

POSITION SENSING METHOD AND APPARATUS FOR
SYNCHRONOUS MOTOR GENERATOR SYSTEM

ABSTRACT

A position sensing apparatus (300) derives rotor position of a
5 synchronous machine (200) from signals output from the machine (200).
In one embodiment, the position sensing apparatus (300) comprises: a
bandpass filter (322) that filters phase voltage signals output from main
stator windings (216) of the synchronous machine (200) during AC
excitation, thereby extracting a rotor position-indicating component from
10 the phase voltage signals; a converter (324) that converts the filtered
phase voltages into balanced two-phase quadrature signals, the balanced
two-phase quadrature signals indicating positioning of the rotor (212); and
an excitation controller (204) for controlling AC excitation frequency as a
function of rotor speed.
